

eLearning courses to teach Lean Six Sigma methodologies and application

12 courses were created for a prominent Lean Six Sigma Training provider to translate their offline curriculum into easy-to-understand online courses.

About the Company

Our client offers training and management solutions that specialize in the application of Lean and Six Sigma methodologies to drive business performance. The company is accredited as a Lean Six Sigma training provider by the International Association for Six Sigma Certification (IASSC).

The Challenge

The client needed to take their offline training courses and recreate them in online format. However, they needed to be chunked and broken down in easy assimilated pieces. This was especially crucial considering the subject matter was so detailed and complex. Each screen was quite different so a normal template-based approach could not be followed as far as design work was concerned.

The Approach

We added graphics and interactivity to explain a complex subject and created a unique design for almost every screen. Test questions were added at intervals to ensure that the topic was being understood.

The Solution

We developed 12 eLearning courses on 'Lean Six Sigma' practices. Development of these courses was done in Articulate Storyline. We selected this authoring tool for two reasons: firstly it helped in fast development and secondly it made the solution cost-effective.

The Result

The client was delighted with the courses and they have been well-received by the students. All the eLearning courses are highly interactive and engaging and the class room curriculum has been successfully translated into engaging online paid courses.
